JRC Dataset

Maximum habitat suitability map of Populus tremula (2006, FISE, RDS-MHSv0-3-2)

Description:
This dataset series shows the Maximum Habitat Suitability (MHS, also known as survivability) map of Populus tremula (raster format: geotiff). The survivability map is provided for Europe (EU28 plus part of other countries within the spatial extent), computed using the FISE harmonised European dataset of taxa presence/absence (based on the integration and harmonisation of the datasets by European National Forestry Inventories; BioSoil; Forest Focus/Monitoring; EUFGIS; GeneticDiversity). The survivability is estimated as the maximum extension of habitat suitability by means of statistical multivariate similarity analysis (Relative Distance Similarity, RDS) of the bio-climatic conditions where the taxon is observed in Europe (RDS Maximum Habitat Suitability, RDS-MHS). Available years: 2006. The maps are available in the Forest Information System for Europe (FISE). FISE is run by the European Commission, Joint Research Centre. See the field Lineage for further information. When using these data, please cite the relevant data sources. A suggested citation is included in the following:

Keywords:
Europe, FISE, Habitats and biotopes, Model: Relative Distance Similarity (RDS-MHS), Modelled quantity: Maximum Habitat Suitability (MHS), Modelling paradigm: Geospatial Semantic Array Programming (GeoSemAP), Taxonomy division type: Broadleaved, Taxonomy family: Salicaceae, Taxonomy genus: Populus, Taxonomy species: Populus tremula, forest, forest resource, mathematical analysis, modelling, natural resource, scientific research, spatial distribution, tree
