

JRC Dataset

UDP - PM10 concentration, 2010 - 2050 (JRC LUISA Reference Scenario 2016)

Description:

This indicator measures the annual mean concentrations of PM10 ($\mu\text{g} / \text{m}^3$). PM10 is one of the main pollutants emitted by household and (to a lower extent) commercial and institutional fuel combustion, followed by industrial activities and transport. Because of its high impact on human health, the EU Air Quality Directive (2008/50/EC) has set forth legally binding limit values for ground-level concentrations of PM10: the daily limit value is set to $50\mu\text{g}/\text{m}^3$. Annual mean concentrations PM10 were calculated using Land Use Regression (LUR) Models. The LUR model was built using annual mean PM10 concentration for 2010 from the monitoring sites included in the AirBase database (dependent variable) and several parameters (independent variables) defined within a Geographic Information System (GIS).

Other resources

Urban Data Platform

The Urban Data Platform is a joint initiative of the Directorate General Joint Research Centre (DG JRC) and the Directorate General for Regional and Urban Policy (DG REGIO) of the European Commission. It provides an access point to exchange information on the status and trends of European cities and regions. It visualizes data via maps at three different geographical units including EU-wide Cities/Greater Cities, Functional Urban Areas and Metropolitan Regions. It also includes time series graphs for selected cities, for Metropolitan Regions, and by degree of urbanisation.
